

Need Premiere Pro CC 2019 or later. Click on Window - click on Essential Graphics. Essential Graphics panel will appear. Click on the small icon in the tin the lower right corner of the Essential Graphics panel - “Install Motion Graphics Template”

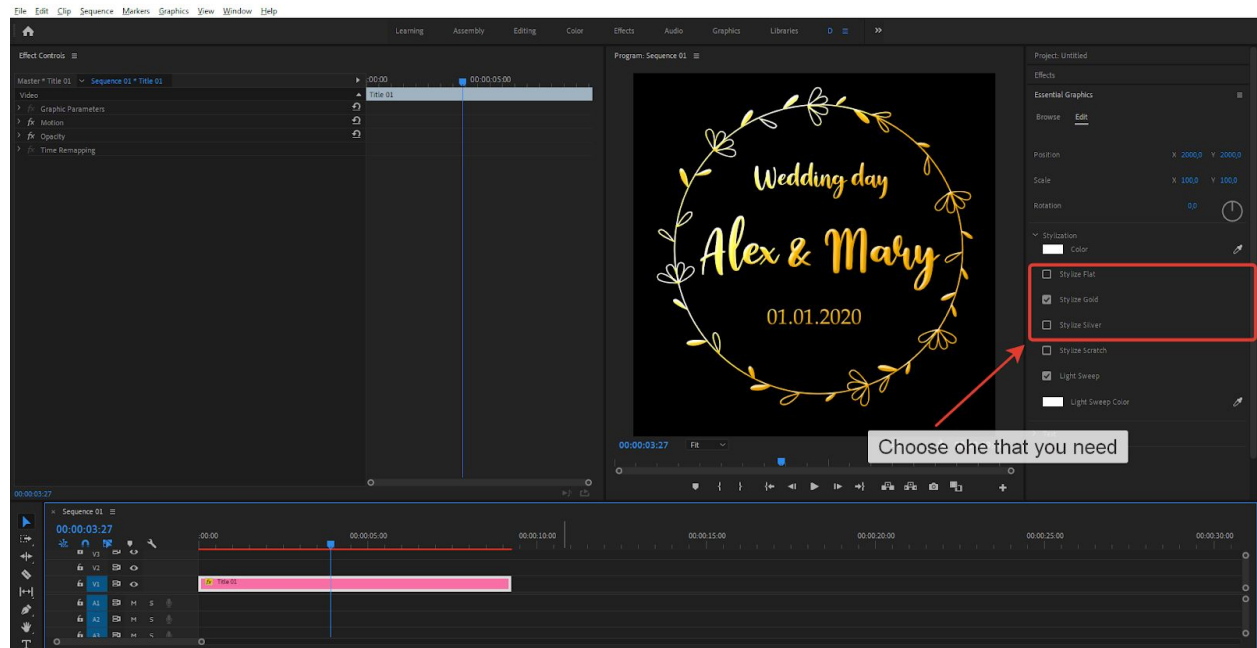

Locate .MOGRT file and click open. File is now installed in your Premiere Essentials Graphics panel. Use the search tab in the Essentials Graphics panel to find it.

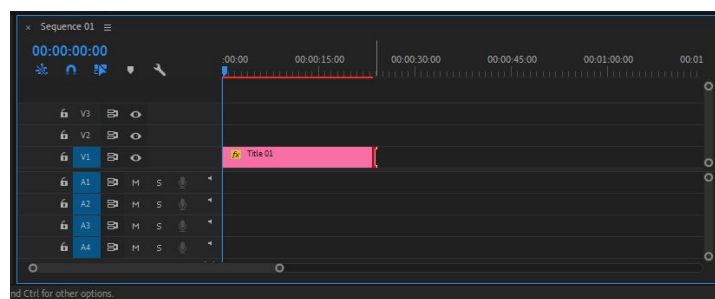

Drag your template file to your sequence on a timeline and drop. Clicking once on the title on the timeline you open the controllers in Essentials Graphics panel with which you can change the color, stylization, font, change the text and use other effects specified there.

For styling in gold, silver or flat, you need to enable one of these checkboxes, they will not work correctly together. The exception is checkboxes Stylize Scratch and Light Sweep - they can be used in conjunction with any stylization.

If you need to increase or decrease the title duration, you just need to pull the right edge of the layer. Right to increase duration, left to decrease. In this case, the input and output animation will not accelerate or slow down, only the static part of the title will change duration.

That's all. Hope you like it, Best regards!
